

ABOUT CODING EFFICIENCY ON NOISELESS CHANNELS

BY

VALERIU MUNTEANU and DANIELA TĂRNICERIU

An efficiency measure for source encoding on noiseless channels is defined. In order to perform the most efficient encoding on noiseless channels, the optimum source probability distribution is derived. For binary Huffman encoding the optimum probability distribution that assures the maximum efficiency will be determined. The maximum and minimum values of the average code word length assuring minimum transmission time will also be computed.
